Chapter 3

Basic Modeling Techniques

In this chapter you learn to model using primitive objects and to apply transforms to move, rotate, and scale them. You learn about sub-object modes and how to use them to modify the objects at sub-object levels. You also learn to clone and group objects and to model objects using the Graphite Modeling Tools located in the Ribbon.

This chapter contains the following topics:

✓ Model with Primitives
✓ Applying Transforms
✓ Sub-Object Mode
✓ Reference Coordinate Systems and Transform Centers
✓ Cloning and Grouping
✓ Poly Modeling with Graphite Tools
✓ Statistics in Viewport
Learning Objectives

This chapter provides instruction to enable you to do the following:

3.1 Model with Primitives
- Understand the different kinds of primitive objects provided with the software.

3.2 Applying Transforms
- Move, rotate, and scale objects using the Transform tools.
- Understand how to constrain the movement of the Transform tools using the toolbar and the gizmo.

3.3 Sub-Object Mode
- Modify objects at a sub-object level using the sub-object modes.

3.4 Reference Coordinate Systems and Transform Centers
- Understand the various coordinate systems and transform systems that can be used during modeling.

3.5 Cloning and Grouping
- Understand how the different options of the *Clone* command can be used to create copies of the same object.
- Understand how the different *Group* options can be used to treat multiple objects as a single unit.

3.6 Poly Modeling with Graphite Tools
- Box modeling using the Graphite Modeling Tools in the Ribbon.

3.7 Statistics in Viewport
- Review the status of the model using the *Summary Info* command.
- Display information about the scene, such as polygon count, number of vertices, etc., in the viewport.
3.1 Model with Primitives

Understand the different kinds of primitive objects provided with the software.

The Autodesk® 3ds Max® Design software enables you to create and adjust 3D geometry by creating a complex model from simple 3D objects called primitives, as shown in Figure 3–1.

Figure 3–1

Different kinds of already built objects, such as Standard Primitives, Extended Primitives, Compound Objects, etc., are listed in the Create>Geometry Command Panel, as shown in Figure 3–2. Each of these categories consists of a group of objects that can easily be modeled by selecting an object type and drawing the model in the viewport. You can use the mouse to drag to the locations (length, height, etc.) or enter the precise values in the Parameters rollout in the Command Panel. These primitives can be used to create simple or complex objects by modifying them.

Figure 3–2
Not everyone works with the Autodesk 3ds Max Design software as their primary modeling tool. However, even for those who do not, modeling with Autodesk 3ds Max Design primitives might still be useful for additional dressing or background objects to add to your imported scenes.

Modeling with primitives is only one approach to creating geometry in the Autodesk 3ds Max Design software. Other processes, such as modeling with modifiers, creating loft compound objects, or creating a 3D terrain from 2D contour objects, can also be done.
### Practice 3a

**Estimated time for completion:** 10 minutes

In this practice you will model the base for the parking lot light fixtures. You will continue with this model in other practices.

6. Open *Modeling with Primitives.max* from your *Class Files* folder. If you get a dialog box that mentions a File Load: Mismatch, click **OK** to accept the default values.

7. In the Command Panel, verify that the Create panel ( ) is selected. Also verify that (Geometry) is selected and that **Standard Primitives** is displayed in the drop-down list. In the Object Type rollout, click **Cylinder**.

8. If the Keyboard Entry rollout is collapsed, click the plus (+) sign to expand it. In the Keyboard Entry rollout, leave the X, Y, Z coordinates at 0'0”. The software places the base center of the cylinder at 0,0,0, location. Set the **Radius** to 1'0” and the **Height** to 3'0” and press <Enter>, as shown in Figure 3–3. Click **Create**.

### Modeling with Primitives

- Create primitive objects by using standard primitives and entering their parameters in the Command Panel.
- Modify the object using the Modify panel in the Command Panel.

**Figure 3–3**

Create primitive objects by using standard primitives and entering their parameters in the Command Panel.

Modify the object using the Modify panel in the Command Panel.

The 0,0,0 location corresponds to the default axes (center of the active grid) of the construction plane. Any value entered for X, Y, and Z, offsets the object by that number in the specified direction.

You can either enter the values directly in the respective fields or use the spinner arrows to increase or decrease the values. After entering a value in a field, click in another edit field or press <Enter> to assign the values to the object.
Hint: Creating Objects

After creating an object, you cannot change the parameters in the Keyboard Entry rollout. Changing the parameters in the Keyboard Entry rollout and clicking Create adds a second object. If you created another object, in the Quick Access Toolbar, click once to undo the creation of second object.

After creating an object, use the Modify panel to change the parameters. Select the object if necessary, and select the Modify panel.

9. Click (Zoom Extents All) display the base more clearly. Note that it zooms into the cylinder in all of the viewports.

10. With the cylinder still selected, in the Command Panel, select the Modify panel ( ). At the top of the modifier list, in the Name field, rename the object from Cylinder001 to LP Base.

11. In the Parameters rollout, set Radius to 1'6". You can also set the number of segments and sides for the object. Try changing these values to see what effect they have on the geometry. Set both Height Segments and Cap Segments to 1 (default) and Sides to 20, as shown Figure 3–4.
12. Select the Create panel ( ) and in the Object Type rollout, click Box to create the anchor base plate. In the Keyboard Entry rollout set X, Y, Z coordinates to 0'0", 0'0", 3'0". This will create the center of the base of the box at the 0,0,3 location, which is the top of the cylinder (the height of the cylinder is 3'-0""). Set the Length and Width to 1'4" and the Height to 0'2". Click Create. A box is created on top of the Base cylinder, as shown in Figure 3–5.

![Figure 3–5](image)

13. With the box selected, click the Modify panel ( ) and rename the object as LP Anchor Base.

14. Expand and select Save As and save your work as MyLight Pole.max.
3.2 Applying Transforms

Move, rotate, and scale objects using the Transform tools.

Understand how to constrain the movement of the Transform tools using the toolbar and the gizmo.

Many CAD and 3D graphic programs consider Move, Rotate, and Scale as modify options similar to Stretch, Break, and Trim. However, in the Autodesk 3ds Max Design software there is a significant distinction between modifiers and transforms.

Modifiers add geometric and property alterations to objects. They are listed in the Modifier Stack and their parameter values are available for adjustment afterwards.

Transforms are used to translate (move) and scale objects in the scene. The three Autodesk 3ds Max Design transforms are Move, Rotate, and Scale. Transforms are conducted by accessing a transform mode and typing new values or graphically transforming objects on the screen.

Transforms are applied to objects after basic parameters and modifiers have been taken into account (except world-space modifiers). For example, if you scale a box, the Length parameter shown in the Modifier Stack does not take into account the effects of the scale transform.

An object can have any number of modifiers, but only has a single set of transform values at any time.

Transforms and almost all object and modifier parameters can be animated in the Autodesk 3ds Max Design software. For example, a walkthrough animation can be created using Move Transform to move the camera or its target or both.

Transform modes are initiated by selecting the required buttons in the Main toolbar or by using the Transform modes in the right-click quad menu.

The Transform tools are:

- Select and Move
- Select and Rotate
To display a toolbar, right-click anywhere on an empty space in the Main toolbar and select the required toolbar.

Transforms can be constrained to one or two axes by selecting one of the buttons in the Axis Constraints toolbar, as shown in Figure 3–6. However, it is more common to use the gizmos or the keyboard shortcuts to constrain the transforms. This toolbar is hidden by default.

**Select and Scale:** Scaling has three flyout options, (Uniform), (Non-uniform), and (Squash). Non-uniform enables you to scale one or two axes independently. Squash enables you to do the same, but scaling one or two axes applies a simultaneous opposite scaling to the other(s). The Scale transform gizmo also has the tools to do Non-uniform scaling.

**Hint: XForm Modifier with Scale**

It is best not to use the Scale transform directly on objects. Instead, apply an XForm modifier to the objects and then Scale the XForm gizmo. This avoids many problems in animation, because you can define when the scale is taking place at the sub-object level.

When a transform mode is active, a Transform gizmo displays, as shown in Figure 3–7, on the selected object on the screen. If the Transform gizmo is missing, press <X> to toggle it on.

Clicking and dragging over the gizmo enables you to perform the transform interactively on the screen. You can also constrain the transform by highlighting an axis handle on the gizmo before clicking and dragging.
You can apply a transform accurately by entering the required transform values in the Transform Type-In area in the Status Bar, as shown in Figure 3–8. You can also use the spinners next to each constraint to change the values.

![Figure 3–8](image)

In the Main toolbar, right-click on the Transform button to open its Transform Type-In dialog box, as shown in Figure 3–9 for the Move transform.

![Figure 3–9](image)

The Transform Type-In dialog box can also be accessed by right-clicking the object and clicking (Settings) to the right of Move, Rotate, or Scale, as shown in Figure 3–10.

![Figure 3–10](image)

Transform modes remain active until they are canceled. One way to cancel a transform mode is by clicking (Select Object) in the Main toolbar or pressing <Q>. You can click (Select Object) after you have finished a transform to avoid accidentally moving, rotating, or scaling objects while making selections.
Practice 3b Modeling with Modifiers and Transforms

Estimated time for completion: 20-30 minutes

In this practice you will refine the parking lot lighting fixture with Modifiers, then use Transforms to locate objects in the correct scene positions.

Task 1 - Extrude and Adjust the Light Pole.

To create the rectangular light pole, create a 2D cross-section shape and then extrude it into a 3D object. This approach is another way to create 3D geometry.

1. Continue working with the file created in the previous practice, MyLightPole.max. If you did not complete it, open Modeling with Modifiers and Transforms.max from your Class Files folder.

2. In the Create panel ( ), click (Shapes) to create 2D objects. Verify that the Splines sub-category is displayed and click Rectangle, as shown in Figure 3–11.

Modeling 3D geometry from 2D shapes is discussed in detail later in the Training Guide.
3. In the Command Panel, expand the Keyboard Entry rollout and set X, Y, and Z to 0'0", 0'0", and 3'2". Set Length and Width to 0'6" each and set Corner Radius to 0'1". Click Create.

4. A 2D rectangle is created on the top of base plate. With the rectangle still selected, open the Modify panel ( ). Expand the Modifier List by clicking the down arrow next to it. In the drop-down list, select Extrude. Note that Extrude is listed in the Modifier Stack above the Rectangle entry, as shown in Figure 3–12.

![Figure 3–12](image)

5. In the Parameters rollout, set Amount to 15'0" and leave the other parameters at their default settings.

6. Rename the object Rectangle001 as LP Pole.

7. Use (Zoom) to get a closer look at the light pole, as shown in Figure 3–13n. Note how much detail the light pole’s fillet adds to the model.

![Figure 3–13](image)
The Extrude modifier is listed directly above the Rectangle object in the Modifier Stack. The rectangle’s parameters are still accessible and can be changed after the extrude is added.

**Hint: Simple Models**
You should cut down on any unnecessary detail if the object is meant to be a background item and not the main focus of the visualization. Keeping models simple reduces the file size and speeds up software performance and rendering times.

8. In the Modify panel ( ), in the Modifier Stack, select **Rectangle**. It is highlighted as dark gray. In the Interpolation rollout change **Steps** to 2 and press <Enter>. The fillet divisions are reduced, as shown in Figure 3–14. (In your projects you might change the **Steps** to 0 or not use fillets at all, if the object is not a focal point of the visualization.)

![Figure 3–14](image)

9. Expand and select **Save As** and save your work as MyLightPole01.max.

**Task 2 - Taper the Light Pole.**

1. In the Modifier Stack, select **Extrude** (so that the next modifier Taper is applied after the Extrude). In the Modifier List, select **Taper**, located at the bottom of this list. Note that the Taper displays above the Extrude in the Modifier Stack. The Modifier Stack lists modifiers in reverse historical order.

2. In the **Taper** area of the Parameters rollout, set **Amount** to -0.5, which relates to approximately a 50% size reduction over the height of the object. Press <Enter>. You can still adjust the original Rectangle and Extrude parameters by selecting them in the Modifier Stack.
3. Click (Zoom Extents All) to see all the objects in the viewport. Note the taper on the pole towards the top.

4. Expand and select Save As. In the Save File As dialog box, click to automatically save your work incrementally as MyLightPole02.max.

**Task 3 - Create the Fixture Housing and Globe.**

Previously you created primitives by keying in exact values in the Keyboard Entry rollout. Now you will roughly size the primitive solids by clicking and dragging with the mouse in the viewport.

1. In the Create panel ( ), verify that (Geometry) is selected. In the Standard Primitives drop-down list, select Extended Primitives as a sub-category. In the Object Type rollout, click ChamferCyl.

2. Next to the base (LP Base), click and drag the left mouse button to size the radius to roughly 2'0" (Keep looking in the Parameters rollout in the Command Panel where the Radius changes interactively as you move your mouse). After releasing the mouse button, move your cursor up the screen slightly to give the cylinder a height of approximately 1'0". Click a second time to set the cylinder height. Then move the cursor up and down the screen until you can roughly define a 0'2" fillet. Complete the object creation process with a third click. The object should display as shown in Figure 3–15.

![Figure 3–15](image-url)
All primitives can be sized by clicks and drags as you did here. You can enter the parameters of the object before creating it or you can sketch in an object this way and fix its dimensions and position after creating it.

3. With the ChamferCyl object still selected, in the Command Panel, select the Modify panel ( ) and modify the parameters, as shown in Figure 3–16.

![Figure 3–16](image)

4. Name the object **LP Fixture Housing**.

5. In the Create panel ( ), click (Geometry). In the drop-down list, select **Standard Primitives** as a sub-category. In the Object Type rollout, click to create the fixture’s globe. Click and drag anywhere on the screen to size a sphere of approximately 1’0” in radius.

Select the Modify panel ( ) and assign the parameters, as shown in Figure 3–17. Note the effects that each of them has on the model, specifically the **Hemisphere** and **Smooth** values.

![Figure 3–17](image)
6. Select the **Squash** option in the rollout. This option generates more faces and creates a smoother appearance. Since the globe is often where the viewer’s attention will be focused when looking at the light pole, you should make it look as good as possible while keeping the polygon count low.

7. Rename the hemisphere **LP Fixture Globe**.

8. Expand and select **Save As** and click to automatically save your work incrementally as **MyLightPole03.max**.

**Task 4 - Use Transforms to Position Objects.**

To complete this practice you will rotate and move the light pole fixture housing and globe into position.

1. Select the **LP Fixture Housing** (the chamfered cylinder) and in the Main toolbar, click (Select and Move).

2. In the Main toolbar, set the **Reference Coordinate System** to **World** by selecting it from the drop-down list and click (Use Pivot Point Center), as shown in Figure 3–18.

   ![Figure 3–18](image)
   
   *If the Transform gizmo is missing, press <X> to toggle it on.*

3. The **Move** gizmo displays over the object, as shown in Figure 3–19. Move the fixture housing by clicking and dragging the gizmo’s axis handles and plane handles, noting how each constrains the movement to a certain axis or plane. By default, the gizmo displays at the object’s pivot point.

   ![Figure 3–19](image)
4. To position the object precisely, use the Transform Type-In controls located in the Status Bar at the bottom of your screen. Verify that (Absolute Mode Transform Type-In) is displayed in the Status Bar. The Absolute Mode button toggles with (Offset Mode). (Absolute Mode Transform Type-In) should display.

- If the values are entered in Offset Mode, they are added to the current coordinates. Offset Mode is useful if you want to move an object a certain distance but are not sure what the resulting coordinates will be.

5. Set X to 0\(^{\prime}\)0\(^{\prime\prime}\), Y to -6\(^{\prime}\)0\(^{\prime\prime}\), and Z to 19\(^{\prime}\)0\(^{\prime\prime}\), as shown in Figure 3–20, and press <Enter>.

![Figure 3–20](image_url)

6. As the Move transform and Absolute Mode are already active, select LP Fixture Globe (hemisphere) and enter the same X, Y, Z coordinates. The globe moves inside the fixture housing.

7. Click (Zoom Extents All) to display all of the objects in the viewport.

8. With the globe still selected, in the Main toolbar, click (Select and Rotate).
9. In the Status Bar, the X, Y, Z Transform Type-In fields display the current rotations which are 0. Set X to 180 and note the position of the globe is inverted. The object should display as shown in Figure 3–21.

![Figure 3–21](image)

10. Click (Select Object) to end the Rotate transform as a precaution to avoid rotating objects accidentally.

11. Expand and select Save As and click to automatically save your work incrementally as MyLightPole04.max.
3.3 Sub-Object Mode

Many of the objects and modifiers in the Autodesk 3ds Max Design software contain sub-objects that can be independently adjusted through transforms and special modifier controls.

These sub-objects are adjusted through a special Autodesk 3ds Max Design state called Sub-object mode. For example, the Taper modifier in the column has Gizmo and Center sub-objects, as shown in Figure 3–22, that can be adjusted to position the Taper.

Sub-object mode is activated through the Modifier Stack. You can expand the modifier by clicking next to the name of an object or modifier that has sub-objects, then clicking sub-object level to be adjusted.

- You normally can have only a single object selected to enter the sub-object mode.
- When sub-object mode is active, the sub-object level (or the modifier name if the sub-object list has not been expanded) is highlighted in yellow (with the default user interface settings).
Geometric Edits through Sub-objects

- Normally you cannot clear the currently selected object while in Sub-object mode. Therefore, to edit another object you must first exit sub-object mode. To do so, select the level of the Modifier Stack presently highlighted in yellow, or select the name of the modifier where you are in sub-object mode.

- If you see your Modifier Stack highlighted in yellow accidentally, (where you did not intend to be in sub-object mode) simply select the yellow highlighted item to exit the mode.

A whole range of explicit geometric changes can be made through sub-object mode.

- Objects imported into the Autodesk 3ds Max Design software often take the shape of Editable Splines or Editable Meshes. These have sub-object controls that can be edited directly. For example, a group of vertices in an Editable Mesh can be selected, moved, or deleted separate to the rest of the geometry.

- Many Autodesk 3ds Max Design objects can also have these controls applied to them through an Edit Spline modifier (for 2D objects) or an Edit Mesh or Edit Poly modifier (for 3D objects). This includes geometry linked to AutoCAD drawings that list only as Linked Geometry in the Modify panel.

- Figure 3–23 shows a Box that is being edited geometrically by lowering two of its vertices with the Move transform.

![Figure 3–23](image)

- The Edit Mesh modifier is best for objects based on a triangular mesh, such as triangulated terrain models. The Edit Poly modifier is best for objects with faces of more than three vertices, such as rectangular objects.
In general it is best to adjust objects through their core parameters (such as the length, width, and height of a Box primitive) and standard modifiers whenever possible. This makes it easier to review the changes and adjust them. For cases where this is not possible, Spline, Mesh, and Poly editing can be an effective alternative.

The Editable Spline, Editable Mesh, and Editable Poly objects (as well as any other object with an Edit Spline, Edit Mesh, or Edit Poly Modifier applied to it) share a number of common sub-object modes. These are:

- **Vertex**: The individual 3D points that define an object (Edit Spline, Edit Mesh, or Edit Poly).
- **Segment**: A single line or curve segment of an Editable Spline.
- **Spline**: A series of one or more connected Editable Spline segments. Segments are considered connected if they share a common vertex.
- **Edge**: The linear segments connecting vertices with Edit Mesh or Edit Poly. Three edges are shown in the button.
- **Face**: The triangular surface area defined by three edges (Edit Mesh only).
- **Border**: A series of edges that define an opening in an Editable Poly (only).
- **Polygon**: Enables you to work with coplanar faces (Edit Mesh) or a defined polygon (Edit Poly).
- **Element**: Enables you to work with all the faces or polygons that form a contiguous whole (Edit Mesh or Edit Poly).

One of the most important properties controlled at the face or polygon sub-object level is smoothing. Figure 3–24 shows the same geometry with and without smoothing applied.
The Autodesk 3ds Max Design software can have two adjacent faces appear to be smooth or faceted. This distinction becomes very important when dealing with curved or gently undulating objects. When smoothed, faces appear smooth but the Autodesk 3ds Max Design software does not adjust the actual geometry.

Smoothing is controlled by smoothing groups. Each face or polygon can be a member of up to 32 smoothing groups. If two adjacent faces share a common smoothing group, the Autodesk 3ds Max Design software attempts to blend the surfaces together to disguise the edge that separates them.

As an example of the controls for polygon smoothing groups (in Edit Mesh and Edit Poly), Figure 3–25 indicates the smoothing groups for the selected faces. When some but not all selected faces fall into a particular smoothing group, that group’s box is shown without a number.

As an alternative to manually assigning smoothing groups there is an Auto Smooth feature. This feature automatically places adjacent selected faces into smoothing groups if their normal vectors have an angle of separation equal to or less than the Auto Smooth angle. (Normals are formally described in the rendering material).
Practice 3c  Modeling with Edit Poly in Sub-Object Mode

Estimated time for completion: 10 minutes

Modify objects at a sub-object level using the sub-object modes.

In this practice you will add some detail to the concrete base of the light pole by chamfering (beveling) the outside top of the cylinder.

1. Continue with the file created in the previous practice MyLightPole04.max. If you did not complete it, open Modeling with Edit Poly in Sub-Object Mode.max from your Class Files folder.

2. Select LP Base and click (Zoom Extents Selected).

3. In the Modify panel (), select Edit Poly from the Modifier List. Click + (plus sign) for Edit Poly to display its sub-object modes. Select Polygon to activate sub-object mode at the Polygon level. The yellow highlighting in the Modifier Stack indicates that you are in the Polygon sub-object mode, as shown in Figure 3–26.
4. Select the polygon at the top of the cylinder, as shown in Figure 3–28. The selected polygon turns red.

5. Creating a 1” bevel will raise the cylinder top by 1”. In preparation you will first lower the top of the cylinder by that same 1”. In the Main toolbar, click (Select and Move). Note that the Move gizmo is displayed.
6. In the Status Bar, click (Absolute Mode Transform) to change it to (Offset Mode Transform) and set Z to -0'1" and press <Enter>. The cylinder geometry is adjusted by moving the polygon down.

7. In the Command Panel, locate the Edit Polygons rollout. You might need to scroll down to locate this rollout. Expand the Edit Polygons rollout, next to , click (Settings), as shown in Figure 3–29.

8. The heads-up display opens on the screen. In the heads-up display, set Height of 0'1" and an Outline of -0'1", as shown in Figure 3–30. Click .

- The base is beveled as shown in Figure 3–31.
9. To make the newly created faces smooth you will adjust the smoothing groups. While still in Polygon sub-object mode, in the pull-down menu, expand **Edit** and select **Select All** to select all of the polygons in the object. In the Command Panel locate the Polygon: Smoothing Groups rollout by scrolling down. Click **Clear All** to remove the existing smoothing. Set the *AutoSmooth angle* to 30, as shown in Figure 3–32, and click **Auto Smooth**.

![Figure 3–32](image)

10. To better see the effect of this change, turn off the **Edged Faces** in the Viewport Shading label, if enabled. The angle of 30 degrees enabled the newly created faces to smooth across each other, but those faces are not smoothed with the top of the cylinder, as shown in Figure 3–33. This is the *chamfered* appearance that was originally intended. A larger smoothing angle enables the chamfered faces between the top and sides to smooth out.

![Figure 3–33](image)

11. To end sub-object mode, in the Command Panel Modifier Stack, click the yellow highlighted **Polygon** to clear the selection.

12. In the Main toolbar, click **(Select Object)** to end the Move Transform mode as a precaution to avoid moving objects accidentally while making further selections.

13. Save your work as **MyLightPole05.max** or use **Save** in the Save As dialog box if using the **MyLightPole04.max** file.
3.4 Reference Coordinate Systems and Transform Centers

Understand the various coordinate systems and transform systems that can be used during modeling.

All geometry in the Autodesk 3ds Max Design software is referenced to a base coordinate system called the Home Grid.

- You can create your own coordinate systems by creating and locating grid objects, available in the Helpers Category in the Create panel.

- User Coordinate Systems created in AutoCAD® can automatically be brought into the Autodesk 3ds Max Design software as grid objects.

- You can also create objects in AutoGrid mode, which creates a temporary Grid aligned in 3D to the object directly under the crosshairs. The option to enable AutoGrid is located in the Create panel, in the Object Type rollout, as shown Figure 3–34 (AutoGrid is similar to the Dynamic UCS feature introduced in AutoCAD 2007). If you hold down <Alt>, the AutoGrid remains available for future use. If you use AutoGrid without any key pressed, the grid disappears after object creation.

Although a single grid is active at any one time, the current Reference Coordinate System might differ depending on which view you are in and which transform is active. It is recommended that new users stay in the World system as much as possible to avoid confusion from changing axis labels. By default, the Reference Coordinate system is set to View.
In the Main toolbar, the options listed in the Reference Coordinate System drop-down list, as shown Figure 3–35, control how transform values are read.

In the **World** coordinate system the X, Y, and Z axes are interpreted based on the Home Grid, even if a user-defined grid is active. To use the coordinates of the active user-defined grid instead, select the **Grid** option.

In the **Screen** coordinate system the X-axis is always measured along the bottom of the viewport, the Y-axis is always measured along the side, and the Z-axis is measured perpendicularly out of the screen. For example, in a front view using the Screen reference system the Y-axis is measured up the screen. That same view in the World system would measure Z-axis up the screen instead.

The **View** system is a combination of World and Screen. In an orthographic view the Screen system is used, while other views use the World system.

The **Pick** option enables you to pick any object in the viewport or from a list and use the reference coordinate system of that object as the reference for transforms. You can use XRef objects with the **Pick** option.

The **Working** option enables you to use the Working Pivot. It is a temporary modeling pivot tool you create from the Hierarchy panel’s Pivot tab. Generally you need to assign a hotkey to **Use Working Pivot** and **Edit Working Pivot** to make them functional tools.
### Transform Centers

Transforms are applied through a Transform Center point indicated by the Transform Gizmo. There are three options for the Transform Center and can be accessed in the Main toolbar, in the Transform Center flyout, as shown Figure 3–36.

![Figure 3–36](image)

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Pivot Point Center</strong></td>
<td>Transforms are applied through each selected object's pivot point. Pivots often default to the bottom center or geometric center of objects. Pivot points can be adjusted through controls in the Hierarchy panel. Select this option if you want to rotate many objects, each around its own center.</td>
</tr>
<tr>
<td><strong>Selection Center</strong></td>
<td>Transforms are applied through the geometric center of all selected objects.</td>
</tr>
<tr>
<td><strong>Transform Coordinate Center</strong></td>
<td>Transforms are applied through the origin point of the current Reference Coordinate System. For example, if you wanted to rotate objects around their individual pivot points about the World Z-axis, you would select the World Coordinate System and Pivot Point Transform Center. Alternatively, to rotate all of the objects around the origin, you would do the same with the Transform Coordinate Center.</td>
</tr>
</tbody>
</table>

- The Transform Center might automatically change depending on whether one or multiple objects are selected, and on the active transform.

- The Reference Coordinate System and Transform Center can be held using **Constant** in **Customize>Preferences>General** tab, as shown in Figure 3–37.

![Figure 3–37](image)
Practice 3d Modeling with Coordinate Systems

Estimated time for completion: 10 minutes

For the next step in the Light Pole model you will add the Light Pole Mounting Arm.

1. Continue with the file MyLightPole05.max created in the previous practice. If you did not complete it, open Modeling with Coordinate Systems.max from your Class Files folder.

2. Click (Maximize Viewport) to display multiple viewports.

3. The Front viewport is unavailable. Select one of the Top viewports, click in the Point of View label (Top), and select Front. Alternatively, after activating a viewport, you can press <F> to change it to the Front viewport. Verify that the Front viewport remains active.

4. Use a combination of Zoom and Pan to zoom into the top portion, as shown in Figure 3–38. If the Grid is showing in the Front view, in the viewport label, click [+] and select Show Grids to clear it. Alternatively, you can press <G> to toggle the grid on or off.

Figure 3–38
5. In the Create panel ( ), click (Geometry), click . Using the mouse, create a small box and center it on the top of the light pole, as shown in Figure 3–39.

![Figure 3–39](image)

6. With this box still selected, in the Modify panel ( ), in the Parameters rollout, set Length and Width to 0’3” and Height to 4’6”. Set the Height Segs to 6 and rename it to LP Mounting Arm.

7. Since you created the box in the Front viewport (rather than the Perspective viewport) the height of the box is measured perpendicular to the view, in this case along the world Y-axis, as shown in Figure 3–40. This is displayed in the Perspective view.

![Figure 3–40](image)
8. Click  (Select and Move). In the Status Bar, set transform mode to  (Absolute mode) and set the location of the mounting arm as shown in Figure 3–41.

![Figure 3–41](image)

9. With the mounting arm selected, in the Modifier List, select **Bend** to curve the arm to the housing. Set **Bend Angle** to **30** and **Direction** to **-90** degrees, and note the effect of each change. The arm is bent as shown in Figure 3–42.

![Figure 3–42](image)

10. Save your work as **MyLightPole06.max** or use  in the Save As dialog box if using the **MyLightPole05.max** file.
3.5 Cloning and Grouping

Understand how the different options of the **Clone** command can be used to create copies of the same object.

Understand how the different **Group** options can be used to treat multiple objects as a single unit.

In the Autodesk 3ds Max Design software, objects can be duplicated with the **Clone** option (**Edit>Clone**). When cloning you have the option of enabling the duplicate object to maintain a dynamic link to the source object. Selecting **Edit>Clone** opens the Clone Options dialog box, as shown in Figure 3–43. An object should be selected to access the **Clone** option. It remains grayed out if no object is selected.

![Clone Options dialog box](image)

**Figure 3–43**

<table>
<thead>
<tr>
<th>Clone Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Copy</strong></td>
<td>Makes an independent copy without a dynamic link to the source object.</td>
</tr>
<tr>
<td><strong>Instance</strong></td>
<td>Makes the duplicate and original Instances of each other. Changes made to any Instance automatically update all Instances, including changes to Modifiers, property changes, and material assignments (but not Transforms).</td>
</tr>
<tr>
<td><strong>Reference</strong></td>
<td>A one-directional link where changes made to the original object affect the duplicate, but you can apply Modifiers to the Reference without affecting the Source object.</td>
</tr>
</tbody>
</table>

- You can also clone an object by holding down <Shift> while transforming through a click and drag on the Transform Gizmo. In this procedure you also have the option of specifying the number of copies you want to make, which are arrayed at the same Transform value.
The Controller area in the Clone Options dialog box applies to objects in a group or hierarchy and refers to transform controllers. For now, you will set it to Copy.

Objects that are instanced or referenced display with the Modifier Stack text in bold type. Instancing or referencing can be disabled by right-clicking the item in the Modifier Stack and selecting Make Unique.

Grouping enables multiple objects to be treated as a single unit for selection and transforms. The Group options are available in the Group pull-down menu, as shown in Figure 3–44.

<table>
<thead>
<tr>
<th>Group</th>
<th>Creates a group out of all the currently selected objects. Groups can have other groups inside them (nested groups).</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ungroup</td>
<td>Dissolves any selected groups back into their constituent objects. Explode dissolves the selected groups and any groups nested inside.</td>
</tr>
<tr>
<td>Open/Close</td>
<td>Enables you to select, modify, and transform individual group members as if they were not in a group. The group is still defined; however, it can be Closed to treat the objects as a single unit again.</td>
</tr>
<tr>
<td>Attach</td>
<td>Enables you to add another object to a group. First select the objects to be attached then select the Attach option in the Group menu. When prompted select a closed group to which to add the objects.</td>
</tr>
<tr>
<td>Detach</td>
<td>Enables you to remove selected objects from a group. You must first open the group to select the objects to be detached.</td>
</tr>
<tr>
<td>Explode</td>
<td>Dissolves the selected groups and any groups nested inside them.</td>
</tr>
<tr>
<td>Assembly</td>
<td>Special case object grouping that are intended for creation of lighting assemblies called luminaires, and for character assemblies. Assemblies have a special helper object called a head that helps build groups that will be animated.</td>
</tr>
</tbody>
</table>
Groups are located in the Command Panel>Modify panel, with group name in **bold type**, and a blank Modifier Stack. The Modifier Stack of individual group members is displayed if it is opened.

Groups can be copied, instanced, and referenced. AutoCAD blocks imported into the Autodesk 3ds Max Design software can be brought in as instanced versions of the same group.

Avoid the use of Grouping on objects that are linked into a hierarchy and then animated.
Practice 3e

Estimated time for completion: 10 minutes

Cloning and Grouping

Create a single unit of multiple objects using the Group command.

Clone an instance of the group and modify a component so that the original object is modified as well.

In this practice you will complete the model of the light pole using Cloning and Groups.

1. Continue with the file MyLightPole06.max created in the previous practice. If you did not complete it, open Cloning and Grouping.max from your Class Files folder.

2. Click (Select by Name) or press <H> (shortcut key) to open the Select From Scene dialog box. In the dialog box, click (Display Geometry) and select LP Fixture Housing, LP Globe, and LP Mounting Arm (hold down <Ctrl> to select multiple items). Click OK to close the dialog box. All three items are now selected in the scene.

3. In the pull-down menu, select Group>Group to combine the three objects together into a single, selectable unit. In the Group dialog box, name the group LP Fixture, as shown in Figure 3–45 and click OK.

4. Click (Select by Name) or press <H> to open the Select From Scene dialog box again. Click (Display Groups) and review the new LP Fixture group. The group name is identified with the symbol. Verify that the group is selected and click OK to close the dialog box.
5. With the **LP Fixture** group still selected, in the pull-down menu, select **Group>Open**. The group still remains intact indicated by the pink bounding box. Once opened you can now select, manipulate, and transform the three component objects separately.

6. With one or more of the group components selected, select **Group>Close**. The pink bounding box is replaced with the white bounding box indicating that it is treated as a single object and the individual components cannot be modified separately.

7. With the **LP Fixture** group closed and selected, create a second fixture by selecting **Edit>Clone**. In the Clone Options dialog box, as shown in Figure 3–46, select **Instance**, if not already selected. This option enables the original group and the copy to share identical geometries. Leave the other options at their default values. Click **OK**.

![Clone Options](image)

**Figure 3–46**

8. The original and the copy now directly overlay each other. Click **Select by Name** or press <H> and in the Select From Scene dialog box, verify that only **LP Fixture001** is selected (highlighted). Close the dialog box. You will now rotate this (second) light fixture.

9. In the Main toolbar, click **(Select and Rotate)**.
10. The position of the transform gizmo is dependent on the active **Use Transform**. If you use **(Use Pivot Point Center)** or **(Use Selection Center)**, the position of the transform gizmo is at the center of your current selection, but the rotation does not place **LP Fixture001** in the correct position. Click **(Use Transform Coordinate Center)**, as shown in Figure 3–47, to use the coordinate system origin as the center of rotation. Note that the Rotation gizmo moves to the base of the light base, which is the coordinate system origin.

![Figure 3–47](image)

11. In the Status Bar, in the **Transform Type-In** area, set **Z** to **180.0**, as shown in Figure 3–48, to rotate **LP Fixture001** by **180°** about the Z axis. Press **<Enter>**. The round off error might result in a **-180°** value. This is a common occurrence and is not necessarily indicative of a problem.

![Figure 3–48](image)

12. The cloned group is moved opposite to the original group, as shown in Figure 3–49.

![Figure 3–49](image)

13. Click **(Select Object)** to end the Rotate transform mode.
14. To verify that the groups are instanced, with **LP Fixture001** selected, select **Group>Open**. Select **LP Fixture Housing001** (chamfered cylinder). In the Modify panel, reduce the **Height** from a **1'0”** to **0' 8”**. Both Fixture Housings update and have reduced height as shown in Figure 3–50.

![Figure 3–50](image)

15. Select **Group>Close** to close **LP Fixture001**.

16. Save your work as **MyLightPole07.max** or use ![Save As](image) in the Save As dialog box if using the **MyLightPole06.max** file.
3.6 Poly Modeling with Graphite Tools

Box modeling using the Graphite Modeling Tools in the Ribbon.

The Autodesk 3ds Max Design software is a powerful environment for creating 3D models of virtually anything you can imagine. The box modeling technique is probably the most popular method of construction. It is also called polygon modeling or mesh modeling. Essentially it is the interactive creation of vertices, edges, faces, and surfaces in a free and artistic way. The term box modeling comes from the common practice of starting by building a box. The original components of the box are manipulated to create the entire model. You could as easily start with a plane, or any other 3D primitive, or a 2D Shape object.

Box modeling can be performed using either the Edit Mesh or Edit Poly modifiers, or be converted to an Editable Mesh or Editable Poly object. Any of these methods give you the access to the sub-object levels needed to do this type of modeling. The Edit Poly modifier is the most recent modeling technology added to the Autodesk 3ds Max Design software, so it should be the preferred choice in many cases. However, if you find unexpected results using Edit Poly, you can always convert the object to an editable mesh or editable poly object and discard the modifier. You can also use the Edit Mesh modifier which is the older technology and should be the most stable.

The Modeling Ribbon (Graphite Modeling Tools tab) provides easy access to polygon modeling tools, including the editing and modification tools used at sub-object level. The Ribbon contains most of the commonly used tools that are present in the Modify panel in the Command Panel. In the Graphite Modeling Tools tab, the polygon modeling and modifying tools are organized into panels. It provides a convenient way of accessing the most commonly used tools while polygon modeling. The Modeling Ribbon can be minimized to the panel tiles, and is docked under the Main toolbar. Click to maximize the Ribbon.
Estimated time for completion: 40 minutes

**Task 1 - Model the Armchair.**

1. Expand and select **Reset** to reset the scene.

2. In the Create panel ( ), click (Geometry), click in the Object Type rollout to activate the Box tool.

3. In the Perspective viewport, click and drag to define the length and width of the rectangle. Click and continue moving the mouse upwards to define the height.

4. Initially you can use the Parameters rollout in the Create panel to edit the values. You can also use the Modify panel to edit the values. Set the **Length** to 4'2", **Width** to 2'9", and **Height** to 0'10" and press <Enter>. In the Perspective viewport, the box should look similar to that shown in Figure 3–51.

**Figure 3–51**

Create an armchair using the box modeling technique.

Edit and modify the geometry using the Graphite Modeling Tools in the Ribbon.
5. In the *Name and Color* field, name the object **armchair**.

6. To better see the edges, change the display mode to wireframe by clicking on the Viewport Shading label (Realistic) and selecting **Wireframe**.

7. Press <G> to hide the grid.

8. If the Modeling Ribbon is only displaying tabs, click to display the tools and the panels.

9. Select the **Graphite Modeling Tools** tab if it is not already active. Expand the Polygon Modeling panel and click **Apply Edit Poly Mod**, as shown in Figure 3–52. This adds an Edit Poly modifier to the Box object. This is also reflected in the Command Panel. Note that the Modify panel is already open and the Modifier Stack displays the **Edit Poly** modifier.

![Figure 3–52](image)

10. Click **(Edge)** in the Polygon Modeling panel, as shown in Figure 3–53, to activate Edge Selection. Alternatively, you can press <2> to select it.

![Figure 3–53](image)

11. In the Navigation toolbar, click **(Zoom Extents All Selected)**.
12. Hold down <Ctrl> and select the upper two long edges, as shown in Figure 3–54. The selected edges turn red.

13. In the Modeling Ribbon, in the Loops panel, press and hold <Shift> and click (Connect) to open the Connect Edges heads-up display.

14. In the Connect Edges heads-up display, set Segments to 2, Pinch to 70 and press <Enter> (leaving Slide as 0). Note that 2 edges are placed along the two short edges, as shown in Figure 3–55.
15. Click + to place a new set of segments along the long edge of the box.

16. Using the spinner arrows to change the *Pinch* and *Slide* values (*Pinch* brings the lines closer to one another and *Slide* moves both of them in the X-direction) to create a rectangle towards the back of the armchair, as shown in Figure 3–56. You can drag their slider arrows in either direction viewing the changes dynamically. The values of *Pinch* and *Slide* are around -30 and -180 respectively. Press <Enter> each time if you enter a new value in the edit box, to see how it affects the lines. Click ✓ (OK).

**Figure 3–56**

---

Use ✫ (Apply and continue) when you need to continue in the same tool. If you want to use another tool, use ✓ (OK) to exit the heads-up display.
17. In the Polygon Modeling panel, click (Polygon), or press <4> to change the sub-object selection level from Edge to Polygon. In the Perspective viewport, right-click and select Select. Hold down <Ctrl> and select the two polygons along the shorter side of the box, as shown in Figure 3–57.

![Figure 3–57](image)

Remember to press <Enter> after entering your values. If you do not do so, you need to click twice. The first time accepts the values and the second time exits the heads-up display.

18. In the Modeling Ribbon, in the Polygons panel, press and hold <Shift> and click (Extrude) to open the Extrude Polygons heads-up display. Set Height to 0’2” and click , as shown in Figure 3–58. Click again to exit the heads-up display if you did not press <Enter> after entering the Height.

![Figure 3–58](image)
19. In the Polygons panel, press and hold <Shift> and click \(\text{Bevel}\) to open the Bevel heads-up display. Set \textit{Height}\ to \(0'1''\) and the \textit{Outline}\ to \(-0'1''\), then click \(\checkmark\), as shown in Figure 3–59. Click \(\checkmark\) again to exit the heads-up display.

![Figure 3–59](image)

20. In the Navigation toolbar, click \(\text{Orbit}\) (Orbit) to orbit in the Perspective viewport so that you can see the back of the armchair. The shortcut for Orbit is \(<\text{Alt}>+\) middle mouse button.

21. Select the long rectangle (along the longer end) for the back of the chair. In the Polygons panel, press and hold <Shift> and click \(\text{Extrude}\) (Extrude) to open the Extrude Polygons heads-up display. Extrude the back of the armchair to \(0'5''\) as shown in Figure 3–60. Press <Enter> and click \(\checkmark\).

![Figure 3–60](image)
22. In the Polygons panel, press and hold <Shift> and click 
(Bevel) to access the Bevel heads-up display. Bevel up 
the back of the chair, as shown in Figure 3–61. Be careful not 
to bevel so much that the edges overlap. The values are 
around 0'7" for Height and -0'2" for Outline. Click .

![Figure 3–61](image)

Use (Orbit) or <Alt> + middle mouse button to orbit in the 
Perspective viewport for a better view around the object.

If some edge(s) are already selected, click in 
an empty area in the viewport to clear any 
selection.

23. Click (Select and Move) and move the selected 
polygons backwards along the X-axis, as shown in 
Figure 3–62. Orbit the viewport to view the design.

![Figure 3–62](image)

24. Press <2> to change to the Edge Selection level. As an 
alternative, click (Edge) in the Polygon Modeling panel.

25. Select one of the long edges at the top of the chair.
26. In the Modify Selection panel, click (Ring Mode). This enables to select a ring of edges when a single edge is selected.

27. Hold down <Alt> and select one edge in front and one edge in the back to remove them from the selection. Only six edges are selected, as shown in Figure 3–63.

![Figure 3–63](image)

28. In the Loops panel, press and hold <Shift> and click (Connect). In the Connect Edges heads-up display, reset the Pinch and Slide to 0, and set the segments to 21 and press <Enter>. This adds 21 vertical segments, as shown in Figure 3–64. Click (Apply and Continue).

![Figure 3–64](image)
29. In the Connect Edges heads-up display, change the *Segments* to 3 and click . If you pressed <Enter> after entering 3, you do not need to click . This adds three rows of horizontal segments to the armchair back. Click ✅ to exit the heads-up display.

30. Click in the **Left** viewport to make it active. Maximize the viewport by clicking  (Maximize Viewport). Use the **Zoom** and **Pan** tools to display the complete model in the viewport.

31. In the Modeling Ribbon, in the Polygon Modeling panel, click  (Vertex) to switch to Vertex selection mode.

32. In the Main toolbar, click  (Select and Move), if not already selected. Drag a selection rectangle around the top row of vertices selecting only the middle vertices, leaving four vertices on each side unselected, as shown in Figure 3–65.

33. The row of vertices selected turns red.

34. Click  (Maximize Viewport) again to display all the four viewports. In the Perspective view, use  (Orbit) and verify that you have selected the correct row (only the top most row) of vertices.
35. In the Command Panel expand the Soft Selection rollout (You are already placed in the Modify panel). Select **Use Soft Selection** and adjust the **Falloff** as shown on the left of Figure 3–66. A rainbow color is displayed. The Red/Yellow/Orange/Green vertices will be affected by the selected transform (e.g., **Move**), while the Blue vertices remain unaffected. Using soft selection, you can verify the vertices that will be affected. You can change the Falloff values to add or remove vertices from the affected/unaffect ed group. The resulting model might differ from that shown in Figure 3–66, based on the values and vertices that you selected.

![Figure 3–66](image)

**Figure 3–66**

You can change the size of the transform gizmo using the <+> and <=>.  

36. In the Main toolbar, click ![Select and Move icon](image) (Select and Move) and move the vertices up, by moving the gizmo along the Z-axis, to create the curved chair back, as shown in Figure 3–67. Note that the dark blue vertices are unaffected.

![Figure 3–67](image)

**Figure 3–67**
37. Click at the top of the Modifier Stack to turn off sub-object selection. The Edit Poly modifier should be highlighted as gray.

38. Press <F3> to toggle from Wireframe to Realistic mode and <F4> to turn on Edged Faces mode. Alternatively, you can click the Viewport Shading menu and select Realistic and Edged Faces. Your model displays as shown in Figure 3–68.

![Figure 3–68](image)

39. Select Rendering>Environment to open the Environment and Effects dialog box. In the Background area, select the Color swatch and select White (color) in the Color Selector dialog box. In the Main toolbar, click ![Render Production](image) or press <F9>. Your rendering should displays as shown in Figure 3–69.

**Hint: Assign Hotkey**

You can assign a hotkey to interactively adjust the Soft selection falloff and pinch in the viewport. To do this, assign a hotkey to Edit Soft Selection Mode. For the exact procedure see: To edit a soft selection in the Viewport in the Autodesk 3ds Max Help.
40. Note that there are some problems with smoothing. The chair looks extremely faceted. In the Modifier Stack or Ribbon, select Polygon or press <4> to access the Polygon sub-object level.

41. Expand the Polygon Smoothing groups rollout. Press <Ctrl>+<A> to select all the polygons, then click Auto Smooth in the rollout, as shown in Figure 3–70. Click in open space in the viewport to deselect all. You will note a subtle change in the viewport display, the edge is softened in the upright chair back.
42. Render the scene by clicking (Render Production) or by pressing <F9>. The rendering shows the smoothing problem has been fixed, as shown in Figure 3–71.

![Figure 3–71](image)

**Task 2 - Apply Geometric Smoothing.**

You can add Geometry Smoothing through **MSmooth** operation.

1. Select all the polygons by pressing <Ctrl>+<A>. If they are completely red, press <F2> to only display the faces in red outline (edges).

2. In the Modeling Ribbon, in the Subdivision panel, press and hold down <Shift> and click **(MSmooth)**. **Msmooth** changes the geometry by adding density to the mesh, as shown in Figure 3–72. Note the mesh is very dense in some parts and not dense enough in others.

![Figure 3–72](image)
Task 3 - Subdivide the Seat.

The back is dense, but the seat is not. You need to select all the polygons that need subdivision and then add a Subdivide modifier to them.

1. Verify that the Polygon level is still active and all the polygons are still selected. If not, press <Ctrl>+<A>. Also press <F2> to display the faces as completely red.

2. In the Main toolbar, expand (Rectangular Selection Region) flyout and click (Paint Selection), as shown in Figure 3–73.

3. In the Perspective Viewport, hold <Alt> and paint to remove the dense polygons (the backrest portion of the seat) from the selection set. Holding down <Alt>, drag the cursor over the polygons that you want to remove from the selection. Note that a circle is attached with the cursor and that as the circle touches the polygon it is cleared from the selection. Leave only the polygons that need subdivision added, as shown in Figure 3–74. Orbit to a different location and continue. If necessary, press <Ctrl> to add polygons back into the set.
4. In the Modifier list, select **Subdivide**. The chair displays as shown in Figure 3–75. Click anywhere in empty space to remove selection.

![Figure 3–75](image)

5. Save your file as **My Armchair.max**.

**Task 4 - Continue Modeling the Armchair.**

If you have time, you can soften up your model using the **Freeform** tools.

1. Continue on the armchair.

2. In the **Graphite Modeling Tools** tab, click ![Polygon](image), if it is not selected. You can also select **Edit Poly** in the Command Panel Modifier List. Press <Ctrl>+<A> to select all of the polygons.

3. Select the **Freeform** tab, as shown in Figure 3–76.

![Figure 3–76](image)
4. In the Paint Deform panel, click \(\text{-}\) (Push/Pull). Access the help in the tool tip by pausing your cursor on the command, as shown in Figure 3–77.

![Figure 3–77](image)

5. Use Push/Pull to create a cushion for sitting. Drag the brush to pull the vertices outward and hold down \(<\text{Alt}>\) to push them in. When you start this command, a Paint Options panel is displayed on the screen, in which you can change the brush size and the brush strength, as shown in Figure 3–78.

In the Quick Access Toolbar, click \(\text{-}\) (Undo) if you pushed/pulled the wrong vertex.

![Figure 3–78](image)

6. In the Paint Deform panel, click \(\text{-}\) (Shift).
7. In the Front view, use the **Shift** tool to stretch and deform the chair back, as shown in Figure 3–79.

![Figure 3–79](image1.png)

8. In the Perspective view, orbit the viewport so that the chair model displays similar to the one shown in Figure 3–80.

![Figure 3–80](image2.png)
**Task 5 - Optimize the Mesh.**

The shape of the chair has been softened. Now you need to reduce the polycount so the file can be used efficiently. The ProOptimizer modifier will achieve this.

1. Select the **Edit Poly** modifier in the stack to disable sub-object mode. In the Modifier drop-down list, select **ProOptimizer**. It will be displayed in the Modifier Stack, as shown in Figure 3–81.

![Figure 3–81](image)

2. In the Modify panel, in the Optimization Levels rollout, click **Calculate**. Change the **Vertex %** to **22**. Use the spinner to move it up or down as shown in Figure 3–82. Keep watching the viewport and also the statistics are displayed in the rollout.

![Figure 3–82](image)

3. Save your work as **Myarmchair_softened.max**.
3.7 Statistics in Viewport

- Review the status of the model using the **Summary Info** command.
- Display information about the scene, such as polygon count, number of vertices, etc., in the viewport.

While Box modeling it is a good idea to frequently review the status of your model. You can expand Properties and select **Summary Info** to find out a lot of information about your file. You can also **Show Statistics** directly in the viewport. To launch statistics, in the viewport label, click [+] select **xView**, and select **Show Statistics**. The total number of polygons, vertices, and Frames Per Second are displayed in the viewport, as shown in Figure 3–83, and are dependant on the options selected in the Viewport Configuration dialog box. Alternatively, press <7> to toggle the statistics display in the viewport on and off.

![Figure 3–83](image)

The statistics options can be controlled by selecting **Views> Viewport Configuration** and in the **Statistics** tab of the Viewport configuration dialog box, as shown in Figure 3–84. Alternatively, in the viewport label, click [+] and select **Configure Viewports** to open the Viewport Configuration dialog box. In the Viewport Configuration dialog box, in the **Statistics** tab customize the display (e.g., **Polygon Count, Triangle Count, Edge Count, Vertex Count**, etc.).
When working in the Autodesk 3ds Max Design software, you can toggle the view of the statistics on and off when you need to see it. Performance might be improved if you keep this off when not in use.

**Hint: Low Polygon Count**
When designing, it is a good idea to keep your Polygon Count or Triangle Count as low as possible to speed up rendering and viewport performance. If you are creating real time models, this impacts the interactive viewport navigation and playback speed.

- When working in the Autodesk 3ds Max Design software, you can toggle the view of the statistics on and off when you need to see it. Performance might be improved if you keep this off when not in use.

**Hint: Use Summary Info**
Sometimes Show Statistics does not seem to give correct results. To check the information, expand Properties, and select Summary Info and then compare the Vertex/Face/Poly count displayed there.
Chapter Review Questions

1. Which of the following are the Transform tools in the Autodesk 3ds Max Design software? (Hint: There is more than one correct answer.)
   a. Move
   b. Stretch
   c. Trim
   d. Scale

2. After launching a Transform tool, if the transform gizmo is missing, which key do you press to display the gizmo on the screen?
   a. <A>
   b. <B>
   c. <X>
   d. <Y>

3. Which Transform center option do you select if you want to rotate many objects, each around its own center?
   a. (Pivot Point Center)
   b. (Selection Center)
   c. (Transform Coordinate Center)

4. Which clone option creates a one-directional link in which changes made to the original object affect the duplicate, but the modifiers applied to the duplicate do not affect the source object?
   a. Copy
   b. Instance
   c. Reference
5. In addition to the Polygon Modeling tools, the Graphite Modeling Tools tab in the Ribbon contains the commonly used tools from which panel of the Command Panel?

a. Modify panel ( )
b. Hierarchy panel ( )
c. Display panel ( )
d. Utilities panel ( )

6. Which key on the keyboard can be used as a shortcut to toggle the statistics display in the viewport on and off?

a. <1>
b. <3>
c. <5>
d. <7>
